## Rational Points on elliptic curves Integer points on cubic curves

#### Ajay Prajapati 170063

Dept. of Mathematics and Statistics Indian Institute of Technology, Kanpur

End-Semester Exam presentation

• Let C be non-singular cubic with integer coefficients given by

$$ax^{3} + bx^{2}y + cxy^{2} + dy^{3} + ex^{2} + fxy + gy^{2} + hx + iy + j = 0 \quad (1)$$

• Natural Number theoretic problem is to describe all solutions (x, y) to cubic equation with x,  $y \in \mathbb{Z}$ .

• Let C be non-singular cubic with integer coefficients given by

$$ax^{3} + bx^{2}y + cxy^{2} + dy^{3} + ex^{2} + fxy + gy^{2} + hx + iy + j = 0 \quad (1)$$

- Natural Number theoretic problem is to describe all solutions (x, y) to cubic equation with x,  $y \in \mathbb{Z}$ .
- If curve given by Weierstrass equation  $y^2 = x^3 + ax^2 + bx + c$  then Nagell-Lutz theorem tells that points of finite order have integer coordinates.
- Converse?  $y^2 = x^3 + 3$  have integer point P=(1, 2) and  $2P = (\frac{-23}{16}, \frac{11}{16})$ . So P is not finite order point.

### How many integer points to expect?

- If rank of C is 0 then by Nagell-Lutz theorem all rational points(finitely many) on C are integer points.
- Suppose C is of rank 1 having trivial torsion. Let P be generator of  $C(\mathbb{Q})$  then any point in  $C(\mathbb{Q})$  is of form nP, for some  $n \in \mathbb{Z}$ . If  $nP = (x_n, y_n)$  then for  $n \ge 3$ ,

$$x_n = \left(\frac{y_{n-1} - y_1}{x_{n-1} - x_1}\right)^2 - a - x_{n-1} - x_1$$
(2)

## How many integer points to expect?

(2)

#### Siegel's Theorem (1929)

A smooth affine algebraic curve C of genus g defined over a number field K, there are only finitely many points on C with coordinates in the ring of integers  $\mathcal{O}$  of K, provided g > 0.

• Famous story? 1729 is the smallest number expressible as a sum of two cubes in two different ways:  $1729 = 9^3 + 10^3 = 1^3 + 12^3$ .

## Taxicabs and sum of two cubes

- Famous story? 1729 is the smallest number expressible as a sum of two cubes in two different ways: 1729 = 9<sup>3</sup> + 10<sup>3</sup> = 1<sup>3</sup> + 12<sup>3</sup>.
- Means cubic curve  $x^3 + y^3 = 1729$  has two integer points upto ordering of x and y, How to prove? Factorize  $x^3 + y^3$ .

## Taxicabs and sum of two cubes

- Famous story? 1729 is the smallest number expressible as a sum of two cubes in two different ways: 1729 = 9<sup>3</sup> + 10<sup>3</sup> = 1<sup>3</sup> + 12<sup>3</sup>.
- Means cubic curve  $x^3 + y^3 = 1729$  has two integer points upto ordering of x and y, How to prove? Factorize  $x^3 + y^3$ .
- Taxicab Equation:  $x^3 + y^3 = m$ . Bound on solutions?

#### Theorem

Let  $m \ge 1$  be an integer. Then every solution to the equation  $x^3 + y^3 = m$  in integers x,  $y \in \mathbb{Z}$  satisfies  $\max\{|x|, |y|\} \le \sqrt{2m/3}$ .

- Means cubic curve  $x^3 + y^3 = 1729$  has two integer points upto ordering of x and y, How to prove? Factorize  $x^3 + y^3$ .
- Taxicab Equation:  $x^3 + y^3 = m$ . Bound on solutions?

#### Theorem

Let  $m \ge 1$  be an integer. Then every solution to the equation  $x^3 + y^3 = m$  in integers x,  $y \in \mathbb{Z}$  satisfies  $\max\{|x|, |y|\} \le \sqrt{2m/3}$ .

#### Theorem

For every N  $\ge$  1, there is an integer m  $\ge$  1 such that the cubic curve  $x^3 + y^3 = m$  has at least N points with integer coordinates.

< □ > < 同 > < 三 > < 三 >

Ramanujan's observation was also that 1729 is the smallest m with two positive solutions. Based on this, people have defined Nth taxicab number: Taxi(N)=min{m ≥ 1: x<sup>3</sup> + y<sup>3</sup> = m has atleast N solutions with x ≥ y ≥ 1}.

Ramanujan's observation was also that 1729 is the smallest m with two positive solutions. Based on this, people have defined Nth taxicab number: Taxi(N)=min{m ≥ 1: x<sup>3</sup> + y<sup>3</sup> = m has atleast N solutions with x ≥ y ≥ 1}.

**Taxi**(6)= 24153319581254312065344

• Till now only 6 taxicab numbers are known. Although upper bounds on next 6 taxicab numbers have been obtained.

# Relationship between number of integer point and rank of group of rational points

• There is an interesting relationship between the number of integer points and the rank of the group of rational points.

# Relationship between number of integer point and rank of group of rational points

- There is an interesting relationship between the number of integer points and the rank of the group of rational points.
- Serge Lang made a general conjecture that has been proven for certain types of cubic curves, including the taxicab curves studied in this section.

#### Theorem(Silverman)

There is a constant K > 1 with the following property. For every integer  $m \ge 1$ , the number of relatively prime integer points on the cubic curve

$$C_m: x^3 + y^3 = m \tag{3}$$

is bounded by the rank of  $C_m$  via the estimate

$$\#\{(x,y)\in C_m(\mathbb{Q}): x,y\in\mathbb{Z}, gcd(x,y)=1\}\leq K^{1+rank(C_m(\mathbb{Q}))}$$
(4)

## Diophantine Approximation

#### **Diophantine Approximation**

This is a branch of mathematics which deals with approximating real numbers with rational numbers.

## Diophantine Approximation

#### **Diophantine Approximation**

This is a branch of mathematics which deals with approximating real numbers with rational numbers.

The first problem was how "well" a real number can be approximated by a rational number. This was solved in 18th century by using continued fractions.

$$\tau = 3 + \frac{1}{7 + \frac{1}{15 + \frac{1}{1 + \frac$$

The first few convergents are 3, 22/7, 333/106, 355/113.

## Diophantine Approximation

#### Diophantine Approximation

This is a branch of mathematics which deals with approximating real numbers with rational numbers.

• The first problem was how "well" a real number can be approximated by a rational number. This was solved in 18th century by using **continued fractions**.

$$\pi = 3 + \frac{1}{7 + \frac{1}{15 + \frac{1}{1 + \frac$$

- The first few convergents are 3, 22/7, 333/106, 355/113.
- Now the main problem is to find sharp upper bound on above approximation. The first result is due to Liouville who used it to prove existence of transcendental numbers by giving an explicit example.

#### Thue's Theorem(1909)(Special case)

Let b be a positive integer that is not a perfect cube, and let  $\beta = \sqrt[3]{b}$  Let C be any fixed positive constant. Then there are only finitely many pairs of integers (p, q) with q >0 that satisfy the inequality

$$\left|\frac{p}{q} - \beta\right| \le \frac{C}{q^3} \tag{6}$$

#### Thue's Theorem(1909)(Special case)

Let b be a positive integer that is not a perfect cube, and let  $\beta = \sqrt[3]{b}$  Let C be any fixed positive constant. Then there are only finitely many pairs of integers (p, q) with q >0 that satisfy the inequality

$$\left|\frac{p}{q} - \beta\right| \le \frac{C}{q^3} \tag{6}$$

The above theorem is special case of more general theorem. The proof is complicated like proof of Mordell's Theorem. So I am going to give only outline and main results that are required in proof.

#### Thue's Theorem(1909)(Special case)

Let b be a positive integer that is not a perfect cube, and let  $\beta = \sqrt[3]{b}$  Let C be any fixed positive constant. Then there are only finitely many pairs of integers (p, q) with q >0 that satisfy the inequality

#### Corollary

Let a, b, c be non-zero integers. Then the equation  $ax^3 + by^3 = c$  has only finitely many solutions in integers x, y.

## Frame Title

#### Proof of corollary

■ It is sufficient to prove corollary for the equation  $x^3 - by^3 = c$  with  $b, c \in \mathbb{Z}, b > 0, c > 0$ .

э

・ロト ・回ト ・ヨト ・ヨ

## Frame Title

#### Proof of corollary

- It is sufficient to prove corollary for the equation  $x^3 by^3 = c$  with  $b, c \in \mathbb{Z}, b > 0, c > 0$ .
- 2 Let  $\beta = \sqrt[3]{b}$ . Then  $x^3 by^3 = (x \beta y)(x^2 + \beta xy + \beta^2 y^2)$ . Now  $x^2 + \beta xy + \beta^2 y^2 \ge 3/4\beta^2$ .

э

< □ > < 同 > < 回 > < 回 > < 回 >

## Frame Title

#### Proof of corollary

- It is sufficient to prove corollary for the equation x<sup>3</sup> − by<sup>3</sup> = c with b, c ∈ Z, b > 0, c > 0.
- 2 Let  $\beta = \sqrt[3]{b}$ . Then  $x^3 by^3 = (x \beta y)(x^2 + \beta xy + \beta^2 y^2)$ . Now  $x^2 + \beta xy + \beta^2 y^2 \ge 3/4\beta^2$ .
- Hence we get,

$$\left|\frac{x}{y} - \beta\right| \le \frac{4|c|}{3\beta^2} \cdot \frac{1}{|y|^3} \tag{7}$$

Then Thue's Theorem says there are only finitely many (x, y) with y > 0. To deal with y < 0 rewrite the equation as following and again apply Thue's Theorem.</p>

$$\left|\frac{-x}{-y} - \beta\right| \le \frac{4|c|}{3\beta^2} \cdot \frac{1}{|y|^3}$$

**③** Suppose we could prove stronger version of (1) with exponent < 3.

$$\left|\frac{p}{q} - \beta\right| \ge \frac{1}{C'q^{2.9}} \tag{11}$$

• Then combining (8) and (9), we get  $q \leq (CC')^{10}$  and we are done.

I How to improve (7)? Let's summarize how we proved it.

- Took polynomial  $f(X) = X^3 b \in \mathbb{Z}[X]$  which has  $\beta$  as a root.
- **2** Noted  $|f(p/q)| \ge 1/q^3$ . Factoring f(X) we saw that |f(p/q)| is  $|p/q \beta|$  times something bounded hence we get (7).

**1** How to improve (7)? Let's summarize how we proved it.

- **0** Took polynomial  $f(X) = X^3 b \in \mathbb{Z}[X]$  which has  $\beta$  as a root.
- O Noted  $|f(p/q)| ≥ 1/q^3$ . Factoring f(X) we saw that |f(p/q)| is |p/q β| times something bounded hence we get (7).
- One way to improve (7) might be to use some other polynomial f(X) ∈ Z[X] instead of X<sup>3</sup> − b.
  - Suppose we are able to find f(X) ∈ Z[X] which is divisible by (X<sup>3</sup> − b)<sup>n</sup> for some n.
  - O Then f(X) factors as

$$f(X) = (X - \beta)^n g(X)$$
 with  $g(X) \in \mathbb{R}[X]$  (12)

**1** How to improve (7)? Let's summarize how we proved it.

- **0** Took polynomial  $f(X) = X^3 b \in \mathbb{Z}[X]$  which has  $\beta$  as a root.
- O Noted  $|f(p/q)| ≥ 1/q^3$ . Factoring f(X) we saw that |f(p/q)| is |p/q β| times something bounded hence we get (7).

  - O Then f(X) factors as

$$f(X) = (X - \beta)^n g(X)$$
 with  $g(X) \in \mathbb{R}[X]$  (12)

S As before, we can show that

$$|F(p/q)| \le C'' |p/q - \beta|^n \tag{13}$$

## continued

Proof continued...

• Since  $F(p/q) \neq 0$ , this implies

$$|F(p/q)| \ge 1/q^d$$
 where  $d = deg(f)$  (14)

② Comparing upper and lower bounds and taking nth roots, we get

$$\left|\frac{p}{q} - \beta\right| \ge \frac{1}{C''} \cdot \frac{1}{q^{d/n}} \tag{15}$$

э

## continued

Proof continued...

• Since  $F(p/q) \neq 0$ , this implies

$$|F(p/q)| \ge 1/q^d$$
 where  $d = deg(f)$  (14)

② Comparing upper and lower bounds and taking nth roots, we get

$$\left|\frac{p}{q} - \beta\right| \ge \frac{1}{C''} \cdot \frac{1}{q^{d/n}} \tag{15}$$

If d < 3n we are done. But d ≥ 3n because (X<sup>3</sup> − b)<sup>n</sup>|f(X). So using this method, we achieve nothing.

## continued

Proof continued...

• Since  $F(p/q) \neq 0$ , this implies

$$|F(p/q)| \ge 1/q^d$$
 where  $d = deg(f)$  (14)

Ocomparing upper and lower bounds and taking nth roots, we get

$$\left|\frac{p}{q} - \beta\right| \ge \frac{1}{C''} \cdot \frac{1}{q^{d/n}} \tag{15}$$

• If d < 3n we are done. But  $d \ge 3n$  because  $(X^3 - b)^n | f(X)$ . So using this method, we achieve nothing.

- ② Thue's brilliant idea which enabled him to prove (8) is to use a two variable polynomial  $F(X, Y) \in \mathbb{Z}[X, Y]$ . He chose the polynomial that vanishes to high order of (β, β) and then compared the upper and lower bound of for the value  $|F(p_1/q_1, p_2/q_2)|$  where  $p_1/q_1$  and  $p_2/q_2$  are solutions of (7).
- Thue's theorem proof naturally breaks into three parts of which we give outline.

## Outline of proof

### Construction of auxiliary polynomial

We construct  $F(X, Y) \in \mathbb{Z}[X, Y]$  with reasonably small coefficients that vanishes to high order of  $(\beta, \beta)$ .

# Outline of proof

### Construction of auxiliary polynomial

We construct  $F(X, Y) \in \mathbb{Z}[X, Y]$  with reasonably small coefficients that vanishes to high order of  $(\beta, \beta)$ .

#### The auxilary polynomial is small

- We assume that there are infinitely many pairs of integers (p, q) that satisfy the inequality (8).
- Under this assumption, we can find a rational p<sub>1</sub>/q<sub>1</sub> satisfying (8) and with q<sub>1</sub> quite large. Then we can find a second rational number p<sub>2</sub>/q<sub>2</sub> satisfying (8) with q<sub>2</sub> much larger than q<sub>1</sub>.

### Construction of auxiliary polynomial

We construct  $F(X, Y) \in \mathbb{Z}[X, Y]$  with reasonably small coefficients that vanishes to high order of  $(\beta, \beta)$ .

#### The auxilary polynomial is small

- We assume that there are infinitely many pairs of integers (p, q) that satisfy the inequality (8).
- Under this assumption, we can find a rational p<sub>1</sub>/q<sub>1</sub> satisfying (8) and with q<sub>1</sub> quite large. Then we can find a second rational number p<sub>2</sub>/q<sub>2</sub> satisfying (8) with q<sub>2</sub> much larger than q<sub>1</sub>.
- We consider the value of the polynomial F(X, Y) at the point (p<sub>1</sub>/q<sub>1</sub>, p<sub>2</sub>/q<sub>2</sub>). Since F(X, Y) vanishes to high order at (β, β) and since (8) says that each p<sub>i</sub>/q<sub>i</sub> is close to β, gives F(p<sub>1</sub>/q<sub>1</sub>, p<sub>2</sub>/q<sub>2</sub>) very small.

### The Auxilary polynomial does not vanish

• This is the subtlest part of the proof. We want to show that  $F(p_1/q_1, p_2/q_2)$  is not zero. Hence,

$$\left| F\left(\frac{p_1}{q_1}, \frac{p_2}{q_2}\right) \right| \ge \frac{1}{q_1^d q_2^e} \tag{16}$$

#### The Auxilary polynomial does not vanish

• This is the subtlest part of the proof. We want to show that  $F(p_1/q_1, p_2/q_2)$  is not zero. Hence,

$$\left| F\left(\frac{p_1}{q_1}, \frac{p_2}{q_2}\right) \right| \ge \frac{1}{q_1^d q_2^e} \tag{16}$$

One of the statistical of the state of th

**③** Unfortunately, we will not be able to show that  $F(p_1/q_1, p_2/q_2) \neq 0$ .

### The Auxilary polynomial does not vanish

• This is the subtlest part of the proof. We want to show that  $F(p_1/q_1, p_2/q_2)$  is not zero. Hence,

$$\left| F\left(\frac{p_1}{q_1}, \frac{p_2}{q_2}\right) \right| \ge \frac{1}{q_1^d q_2^e} \tag{16}$$

- One of the statistical of the state of th
- **③** Unfortunately, we will not be able to show that  $F(p_1/q_1, p_2/q_2) \neq 0$ .
- Instead we show that some derivative of F does not vanish at  $(p_1/q_1, p_2/q_2)$ . This means in step 2, we need to give upper bound on the values of the derivatives of F.

We will build F is by solving a system of linear equations with integer coefficients. Siegel was first person to study integer solution of linear system with integer coefficients.

We will build F is by solving a system of linear equations with integer coefficients. Siegel was first person to study integer solution of linear system with integer coefficients.

Siegel's Lemma(1929)

Let N > M be +ve integers and let

be a system of linear equations with integer coefficients. Then there is a non-trivial solution  $T = (t_1, ..., t_N)$  satisfying

$$max_{1 \le i \le N}|t_i| < 2(4Nmax_{i,j}|a_{ij}|)^{\frac{N}{N-M}}$$
(17)

### Auxiliary Polynomial Theorem

Let  $b \in \mathbb{Z}$  and  $\beta = \sqrt[3]{b}$  and let  $m, n \in \mathbb{Z}$  s.t.  $m \ge 3$  and  $m = \lfloor \frac{2}{3}n \rfloor$ . Then there is a non-zero polynomial

$$F(X,Y) = P(X) + YQ(X) = \sum_{i=0}^{m+n} (u_i + v_i Y) X^i$$
(18)

of degree at most m+n and having the following properties:

• 
$$F^k(\beta,\beta) = 0$$
 for all  $0 \le k < n$ 

• 
$$max_{0 \le i \le m+n} \{ |u_i|, |v_i| \} \le 2(16b)^{9(m+n)}$$

#### Smallness Theorem

Let F (X, Y) be a polynomial as described in previous theorem. Then there is a constant  $c_1 > 0$ , depending only on b, so that for any x,  $y \in \mathbb{R}$ with  $|x - \beta| \le 1$  and for any integer  $0 \le t \le n$ , we have

$$F^{(t)}(x,y)| \le c_1^n(|x-\beta|^{n-t}+|y-\beta|)$$
(19)

Now, we want that if x and y are rational numbers, then F(x, y) is not zero. Unfortunately, it is not possible to prove such a strong result. Instead, it is shown that some derivative  $F^{(t)}(X, Y)$ , with t not too large, does not vanish. Now, we want that if x and y are rational numbers, then F(x, y) is not zero. Unfortunately, it is not possible to prove such a strong result. Instead, it is shown that some derivative  $F^{(t)}(X, Y)$ , with t not too large, does not vanish.

#### Non-vanishing theorem

Let F(X, Y) be an auxiliary polynomial as above. Let  $p_1/q_1, p_2/q_2 \in \mathbb{Q}$  in lowest terms. Then there is a constant  $c_2$ , depending only on b, and an integer t satisfying

$$0 \le t \le 1 + \frac{c_2 n}{\log q_1} \tag{20}$$

so that

$$F^{(t)}\left(\frac{p_1}{q_1}, \frac{p_2}{q_2}\right) \neq 0 \tag{21}$$

# Main result

### Diophantine Approximation Theorem

Let b be a positive integer that is not a perfect cube, and let  $\beta = \sqrt[3]{b}$  Let C be any fixed positive constant. Then there are only finitely many pairs of integers (p, q) with q >0 that satisfy the inequality

$$\left|\frac{p}{q} - \beta\right| \le \frac{C}{q^3}$$
 (22)

#### Proof

- Assume above inequality has infinitely many solutions.
- 2 We can find a solution  $(p_1, q_1)$  s.t.  $q_1 > e^{9c_2}$  and  $q_1 > (2c_1C)^{18}$
- We can find a solution  $(p_2, q_2)$  satisfying  $q_2 > q_1^{65}$ .
- Let n be the integer satisfying  $n = \left\lfloor \frac{9}{8} \cdot \frac{\log q_2}{\log q_1} \right\rfloor$ . Exponentiating this becomes,  $q_1^{\frac{8}{9}n} \le q_2 < q_1^{\frac{8}{9}(n+1)}$ .

# Proof

#### Proof

- Clearly,  $n > \frac{9}{8}.65 1 > 72$ .
- Q Use Auxilary Polynomial Theorem and above value of n to find polynomial F(X, Y). Use non-vanishing theorem to find integer t s.t. 0 ≤ t ≤ 1 + c<sub>2</sub>n/logq<sub>1</sub> < 1 + 1/9 n and F<sup>(t)</sup> (p<sub>1</sub>/q<sub>1</sub>, p<sub>2</sub>/q<sub>2</sub>) ≠ 0.

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

Combining the above 2, we get

$$\frac{1}{q_1^{23n/9+8/9}} \le \left| F^{(t)}\left(\frac{p_1}{q_1}, \frac{p_2}{q_2}\right) \right| \le \frac{1}{q_1^{47n/18-3}}$$
(24)

Image: A matched by the second sec

æ

Combining the above 2, we get

$$\frac{1}{q_1^{23n/9+8/9}} \le \left| F^{(t)}\left(\frac{p_1}{q_1}, \frac{p_2}{q_2}\right) \right| \le \frac{1}{q_1^{47n/18-3}}$$
(24)

Image: A matched by the second sec

2 This means 
$$q_1^{\frac{1}{18}n-\frac{35}{9}} \le 1$$
.

æ

Combining the above 2, we get

$$\frac{1}{q_1^{23n/9+8/9}} \le \left| F^{(t)}\left(\frac{p_1}{q_1}, \frac{p_2}{q_2}\right) \right| \le \frac{1}{q_1^{47n/18-3}}$$
(24)

2 This means 
$$q_1^{rac{1}{18}n-rac{35}{9}} \leq 1.$$

• As  $n \ge 72$  was chosen, this means  $q_1^{\frac{1}{9}} \le 1$ . This is absurd because integer  $q_1$  is certainly  $\ge 2$ . This completes the proof.

### Thue's Theorem (1909)

Let  $\beta \in \mathbb{R}$  be the root of an irreducible polynomial  $f[X] \in \mathbb{Q}[X]$  with  $d = deg(f) \ge 3$ . Let  $\epsilon > 0$  and C > 0 be positive numbers. Then there are only finitely many pairs of integers (p, q) with q > 0 that satisfy the inequality

$$\left|\frac{p}{q} - \beta\right| \le \frac{C}{q^{1+d/2+\epsilon}} \tag{25}$$

### Thue's Theorem (1909)

Let  $\beta \in \mathbb{R}$  be the root of an irreducible polynomial  $f[X] \in \mathbb{Q}[X]$  with  $d = deg(f) \ge 3$ . Let  $\epsilon > 0$  and C > 0 be positive numbers. Then there are only finitely many pairs of integers (p, q) with q > 0 that satisfy the inequality

$$\left|\frac{p}{q} - \beta\right| \le \frac{C}{q^{1+d/2+\epsilon}} \tag{25}$$

- A number of mathematicians have strengthened the Thue's result.
- We might ask for what value of \(\tau(d)\) is it true that there are only finitely many rational numbers satisfying

$$\left|\frac{p}{q} - \beta\right| \le \frac{C}{q^{\tau(d) + \epsilon}} \tag{26}$$

### Results in Diophantine approximation

The following traces the history of the problem:

- Liouville (1851)  $\tau(d) = d$
- Thue (1909)  $\tau(d) = 1 + d/2$
- Siegel (1921)  $\tau(d) = 2\sqrt{d}$
- Gelfond, Dyson (1947)  $\tau(d) = \sqrt{2d}$
- Roth (1955) τ(d) = 2

### Results in Diophantine approximation

The following traces the history of the problem:

- Liouville (1851)  $\tau(d) = d$
- Thue (1909)  $\tau(d) = 1 + d/2$
- Siegel (1921)  $\tau(d) = 2\sqrt{d}$
- Gelfond, Dyson (1947)  $\tau(d) = \sqrt{2d}$
- Roth (1955) τ(d) = 2

Roth theorem is somewhat surprising, says for every degree d, we can take \(\tau(d) = 2\). It is the strongest theorem of this form because any \(\tau(d) < 2\) would not work. Roth won Field's medal in 1958 for this work.</li>

- There are higher dimensional generalisation (both proven and conjectural) due to Schmidt, Vojta and Faltings.

• The proof that we gave for our **special case** of Thue's theorem contains all of the ingredients that appear in general.

- The proof that we gave for our **special case** of Thue's theorem contains all of the ingredients that appear in general.
- One constructs an auxiliary polynomial, evaluates it at some rational numbers, shows that it (or a small derivative) does not vanish, and derives a contradiction by giving upper and lower bounds for its magnitude.

- The proof that we gave for our **special case** of Thue's theorem contains all of the ingredients that appear in general.
- One constructs an auxiliary polynomial, evaluates it at some rational numbers, shows that it (or a small derivative) does not vanish, and derives a contradiction by giving upper and lower bounds for its magnitude.
- Siegel, Gelfond, and Dyson obtain their stronger results by using a general polynomial F(X, Y), rather than a polynomial of the form P(X)+YQ(X) as used by Thue.
